

PeakAndPack Test Strategy (Manual + AI)

Phase: 2, Approach B, Manual + AI **Based on:** peakandpack-requirements.md (Phase 1), refined with Claude **Author:** RN, with Claude assistance

Scope

The same scope as test-strategy-manual.md : all six PeakAndPack feature areas (products, cart, checkout, auth, orders, search), prioritised by business risk. This version was stress-tested against a second opinion before being finalised, so the risk ranking and test types below include a few areas the first manual pass did not surface (injection risk in query parameters, token expiry behaviour, and concurrent cart modification).

Risk ranking by feature area

Rank	Area	Why it's risky
1	Checkout / discount logic	Silent pricing errors at scale
2	Auth / orders visibility	Data leak risk between users
3	Cart totals + concurrency	Wrong totals, or race conditions on simultaneous edits
4	Product listing / search	Includes injection risk in sort/search params
5	Sort order	Cosmetic only

Test types planned

The same test types as the manual version, plus two added during the refinement pass:

- **Functional:** each feature area exercised for happy path, negative, and edge behaviour.
- **Security spot-check:** sort/search parameters tested against basic injection strings.
- **Session boundary:** behaviour immediately after token expiry (the 24-hour window).
- **Concurrency:** two requests modifying the same cart at once.

Entry / exit criteria

Unchanged from test-strategy-manual.md .

Review note

This is AI-assisted, not AI-authored. Every addition above was evaluated against the actual Phase 1 requirements doc before being kept, not accepted automatically.
