

PeakAndPack Test Cases (Manual + AI)

Phase: 3, Approach B, Manual + AI **Based on:** peakandpack-requirements.md (Phase 1), drafted with Claude, reviewed by RN **Author:** RN, with Claude assistance

How this differs from the manual set

Same format and scope as test-cases-manual.md , but the first draft came from Claude: paste the requirements per feature area, ask for happy/negative/edge cases, get a table back. The value is in the review pass that followed, not the drafting. Claude is fast and broad at generic edge cases (empty fields, negative numbers, missing params across every endpoint). It cannot know app-specific rules unless the requirements doc tells it, so those had to be added or corrected by hand.

What the review pass changed

Change	Why
Corrected the SAVE10 expectation to exactly 10 percent off	The draft assumed a generic discount. Only the requirements doc says SAVE10 is 10 percent, not 100. This is what makes TC-201 able to catch BUG-009.
Added the stock-check-before-checkout case	The draft had no concept of stock state; the requirements describe it, so the case was added by hand (TC-204).
Added the cross-user order access case	The draft tested order retrieval generically but never tested user A reading user B's order, the actual data-leak risk.
Removed nine duplicate generic cases	The draft produced near-identical empty-field cases for every endpoint; kept one representative each.

Test cases (after review)

Checkout

TC-ID	Title	Steps	Expected	Priority
TC-201	Checkout with valid discount	Add item, apply SAVE10, submit	Total reduced by exactly 10 percent	Critical
TC-202	Checkout with empty cart	Submit checkout with no items	400, no order created	High
TC-203	Checkout with invalid code	Apply FAKE99, submit	Code ignored, full price charged	Medium
TC-204	Checkout with out-of-stock item	Add item with stock 0, submit	Order rejected, stock checked first	High
TC-205	Price tampering on checkout	Submit checkout with an altered price in the payload	Server ignores client price, uses its own	Critical

Auth

TC-ID	Title	Steps	Expected	Priority
TC-211	Register valid	Register with valid email and password	201, account created	Critical
TC-212	Register no password	Register with password blank	400, no account created	Critical
TC-213	Login wrong password	Correct email, wrong password	401, no session	Critical
TC-214	Protected route logged out	Request orders with no session	401	Critical
TC-215	Token after expiry	Use a token past its 24-hour window	401, re-login required	High

Orders

TC-ID	Title	Steps	Expected	Priority
TC-221	View own orders	Logged-in user views their orders	200, only their orders	Critical
TC-222	Cross-user order access	User A requests user B's order id	403 or 404, never B's data	Critical
TC-223	Order total correct	Open a multi-item order	Total matches amount charged	High

Cart

TC-ID	Title	Steps	Expected	Priority
TC-231	Add item, total updates	Add one in-stock product	Item in cart, total correct	High
TC-232	Negative quantity	Set quantity to -1	Rejected, cart unchanged	High
TC-233	Cart total accuracy	Add three different items	Total equals sum of line totals	Critical

Products, search, sort

TC-ID	Title	Steps	Expected	Priority
TC-241	List products	Request the product list	200, array of products	High

TC-242	Search empty query	Submit a blank search	400 or full list per spec, never 500	High
TC-243	Search special characters	Search with a quote or script tag	Handled safely, no injection, no crash	High
TC-244	Sort invalid field	Sort by a non-existent field	Default or 400, no crash	Low

Review note

This is AI-assisted, not AI-authored. Every case above was checked against the Phase 1 requirements before being kept. The cases that matter most, TC-201 and TC-204, are exactly the ones the AI draft got generically wrong or omitted, which is the whole reason the human review pass exists.
